

# Determining department from email content using Fuzzy Logic

For our BSc project:  
Fundamentals of Fuzzy Logic

Peter Heemskerk  
Jim Kamans  
Stefan Schenk

December 2017

# Goal and relevance

For complex organisations it is difficult to answer email questions from customers / other parties in time.

Our goal:

use e-mail content to determine the correct department which should reply on an email.

# Literature

- Fuzzy Logic has been used for e-mail classification (spam, anti-phishing).
- Main idea from Ferolin:
  - extract from e-mail content linguistic generalised features (like “technical”, “financial”, “emotional”).
  - use these linguistic features as input for a fuzzy logic system to determine the departements.

# Collaboration

Stefan: code and experiments

Peter: fuzzy logic and reporting

Jim: “vliegende keep” (trouble shooting)

Collaboration with tools: Github, Trello, Google Drive

**Sprint 5 - Milestone 3 - 19 Dec** ☆ **Fuzzy Logic Email Classification** Free | Team Visible

### Todo

Type	Term	Total	Distinct
email	["bob", "bob", ...]	5	1
word_list	["bob", ...]	100	100
feature1	["x", ...]	10	10
feature2	["y", ...]	50	50
feature3	["bob", ...]	40	40

Method	Score	Rounded
exact	5/100	0.05
distinct	1/100	0.01
isolate	1/40	0.025
direct	5/40	0.125

# Approach

# Data after preprocessing and Ranking

{ 'handhav', 'rijbewijs', 'kopie', 'daadwerk', ... }

⇒

{'handhav': 2, 'rijbewijs':1, 'kopie': 1, ... }

⇒

{'handhav': 0.0 0.0 0.2 0.0,

'rijbewijs': 0.0 0.0 0.1 0.0,

'kopie': 0.0 0.1 0.1 0.1, ... }

⇒

{'basisinformatie': 0.0, 'belasting, werk en inkomen': 0.5, 'openbare ruimte': 1.0, 'parkeren': 0.3}

# Implementation

[0.0, 0.5, 1.0, 0.3]

openbare ruimte

IF f1 = low THEN d1 = low  
IF f1 = med THEN d1 = med  
IF f1 = high THEN d1 = high

: : :

:

IF f1 = low & f2 = low & ... THEN d1 = high

# Experiments and Results

# Results, Observations and Discussion

## Accomplishments:

- baseline
- focus on feature word list generation
- basic fuzzy logic implementation
- for translating 4 features into 4 departments (feature “Parkeren” into department “Parkeren”)
- score of 46% correctly classified by 70/30 split

## Improvements:

- extend feature baseline (based on word clustering of large email dataset)
- learn fuzzy logic rules from a large labeled training dataset.
